

IN THE SPECIFICATION

In the Brief Description of the Drawings, following the description of Figure 3, please amend the description of Figure 4 as follows and add the description of Figure 5 as shown below:

Figure 4 is an end elevational view of the adjustable lie board being used to fit a club thereon; and

Figure 5 is a side elevational view of the adjustable length fitting club showing the shaft extensions usable therewith which is used in connection with the method of the present invention; and

Please delete the paragraphs shown below which were submitted in connection with the responses of October 12, 2005 and February 10, 2006:

~~Note: To achieve this required dead weight at the +1" overlength, a test club with a light-weight steel shaft or a tour weight graphite (with the proper shaft flex) must be used. A standard weight steel shaft would produce a club which is too high in dead weight, and a standard weight graphite shaft will result in too little total weight. The initial desired balance of this club is achieved by installing the proper weight screws, if needed, to the back of the test club head.~~

~~Here is where an existing *favorite* club's specifications can be considered. For example, if the player has been playing clubs balanced on the head-heavy side (below the reference line on the fitting chart) the test club can be setup with a slightly heavier than *normal* head to help accommodate the existing learned-swing action. Through further test hitting, this head weight can be varied slightly to achieve the best possible results for this player. A club with a Balance Index which plots above its reference line, while feeling lighter in the head, will tend to produce a drawing or pulled ball flight through less resistance against the player. A head-heavy Balance Index will tend to produce a fading or pushed ball flight, and in both cases, on a directly proportional basis.~~

1 Please insert the following sentence on page 15 before the material which was added on that  
2 page in the response of October 12, 2005 and February 10, 2006:

3 It should be noted that there are at least two methods by which the Balance  
4 Index may be selected, with the first being the use of the player's favorite club as was  
5 stated above, and with the second being by using the grip strength of the individual  
6 golfer as has been described previously and which will be described in greater detail  
7 as follows.
